

The decision is bounded by declared evidence, route, and readiness

Evidence is sufficient to assess each domain. Readiness is not sufficient to collapse them into one opaque answer.

Benefits are ahead of plan, but future economics remain the decision basis

ACTUAL BENEFIT VS CURRENT PLAN

FUTURE BENEFIT BRIDGE

Current delivery is ahead of plan; the decision still rests on future incremental economics, not sunk cost.

Sequential gates favor the strongest future incremental option

AUDITED OPTION ECONOMICS

Metric	Continue	Pivot	Stop
NPV	100.41	69.42	-10.91
Incremental NPV	111.32	80.33	—
Incremental ROI	3.85	1.92	—

PREScriptive - 10/10 GATES PASS

Continue leads on both NPV and incremental ROI. Values are presentation formatting of audited output.

Fixed anchors preserve comparability across portfolio options

Method: complete enumeration. Hard constraints precede scoring; selection is not a naive top-N cutoff.

Allocation changes are exposed by bounded capacity scenarios

TEAM CAPACITY - NORMALIZED TO EACH SCENARIO CEILING

Base binds both team capacity and budget; downside creates headroom; relief raises the ceiling without changing the selected mix.

Driving dependencies, not task count, determine the finish

Binding and near-critical constraints define the recovery boundary

BINDING NEGATIVE-FLOAT PATH

A → B → D → F is already binding. C → E → G is the next recovery risk if one working day is lost.

Mitigation economics must be read with residual exposure and tolerance

Treatment value is conditional on calibrated probability and consequence

COMMON MONETARY SCALE

Economics are positive only within the calibrated probability, consequence, and treatment-cost assumptions.

Recommendation, counterargument, sensitivity, and evidence boundary stay together
